

RESIN IS A CHEMICAL, NOT A PLASTIC

A part fresh off the printer is coated in uncured resin. Nitrile gloves.

It does not have to hurt to harm you

The support material is a Category 1 skin sensitiser. Repeated small exposures can build a permanent allergy — after which even a trace sets it off. A little on your hands every week for a semester is how that happens. Absence of pain is not absence of harm.

Diluting caustic soda? Caustic soda INTO water. Never water into caustic soda.

The rules

- Nitrile gloves — not latex, which acrylates go straight through.
- Gloves come OFF before you touch a door, a phone or a keyboard.
- Resin in the eye: rinse 15 minutes, under the eyelids too, then get treatment. This is Category 1 eye damage.
- Resin on skin: soap and water, 15 minutes.
- A part is safe bare-handed only after full support removal and washing.
