

Engineering Technology

Welcome Packet

Everything you need for your first week

Who to ask for what, what to wear, how the shop runs, and how you are graded. Keep this — the answers to most first-term questions are in here.

WHAT IS INSIDE

- Page 1** Welcome, who to ask, what you can earn
- Page 2** What to wear, safety in short
- Page 3** Classroom rules and privileges
- Page 4** How you are graded
- Page 5** Sign and return

Welcome to the shop

You are joining a program that treats you like an engineer rather than a student who happens to be in a shop. You will design things, build them, test them, and explain why they worked or did not. Some of what you make will fail. That is part of it — what matters is that you can say why.

Who to ask for what

MR. FRANK · GRADES 11 & 12	MR. DRYER · GRADES 9 & 10
Helps you make it real — how it looks, how it is drawn, how it gets built. • Designing in CAD so it works and looks right • Getting a part ready to 3D print or laser cut • Making a structure that holds up • Drawings someone else could build from • Fixing a prototype that came out wrong	Helps you make it work — circuits, code, and proving it performs. • Designing or troubleshooting a circuit • Writing and debugging code for a board or robot • Working out why a system misbehaves • Getting sensors and motors working together • Showing with data that it does what you claim
Both of us teach across all four years. Go to whoever fits the problem in front of you — you will not be sent away for asking the wrong one.	

What you can earn here

- OSHA 10 — Construction** in Grade 10. This is the credential that lets you work on the equipment, and it is recognized well outside this building.
- Autodesk Certified User** in Inventor, Fusion 360 and Revit Architecture. Which ones you go for depends on the work you are doing and when you are ready.
- Cooperative education** — working in a real engineering setting for part of your schedule. Available to juniors from Term 3 and seniors from Term 1.

What to wear

You wear a uniform during your shop week. It is not about looking smart — it is about being dressed for a room with machines in it.

ITEM	WHAT IS REQUIRED
Shop attire	Anything carrying the Engineering Technology logo, bought through the school store — T-shirts long or short sleeve, hoodies, crew necks, quarter-zips, sweaters. Any of it counts.
Footwear	Shoes, sneakers or work boots. No open-toed shoes, sandals or Crocs in the Makerspace.
Eye protection	Required in the Makerspace. Situational in the main shop — if you are unsure, put them on.
Not required	Sweatshirts are available but optional. They carry the Blue Hills logo on the front and the Engineering Technology logo on the back.

Ordering. Uniforms are ordered at store.bluehills.org during the window posted on the website — that is when pricing is best and delivery to the school is free. There is no limit on how many you buy; most students get at least two. Refer to the Blue Hills Parent/Student Handbook for anything else about attire.

Safety, in short

The full rules are posted in the shop and you will be trained on them. These are the ones that matter before you touch anything.

- Report every injury immediately, however small. If a chemical gets in your eyes, wash for **15 minutes** before seeking treatment.
- Never use a tool you have not been trained and authorized on.
- Never work alone with power tools — two people, both visible to each other.
- Machines run only with all guards and shields in place. Never walk away from a running tool.
- Clean your area every time you leave it, including the floor.

Classroom rules and privileges

In order for us to live well with each other, we need some boundaries. Rules are not to restrict us; rules are given to us to fully enjoy the privileges of education, each other, and the equipment we have been given.

- 1 Cell phones during break and lunch only. Headphones are allowed **occasionally** while working on individual projects.
- 2 Appropriate uniform, attire, and PPE are required and are part of your weekly grade. Maintain a professional workspace and use professional language and behavior.
- 3 No eating or drinking in shop common areas.
- 4 **Respect** your teacher and classmates — which includes their property, their space, and their creativity.
- 5 The Engineering Lab and its equipment are used with permission. No writing, drawing or cutting on tables. Do not intentionally misuse equipment or property.
- 6 Return things to their proper places after use. Clean up after **yourself and others**. Follow the end-of-day cleanup routine. This is all of our workspace, so keep it clean.
- 7 **Stay in your assigned area.** Do not leave the shop without verbal permission or an e-hall pass.
- 8 Computers are for educational purposes. When your work is done, ask a teacher for more, help a classmate, or help the department.
- 9 **Time.** Be on time for class and for deadlines. Break and end-of-day preparation don't start until the instructor grants them.
- 10 Communication is key. If you have questions or concerns, it is **your** responsibility to ask before the assignment is due, so what you hand in is grade-level work.
- 11 Always work to your potential. Prepare to be challenged.

Bonus rule: use common sense.

Some of these are privileges, and privileges are not guaranteed. Follow the rules and we keep them — here and in the shop.

How you are graded

Your grade comes from four categories. Notice what they add up to.

CATEGORY	WHAT IT MEASURES	WEIGHT
Project Grade	Individual rubrics are created for each project. Graded on productivity, creativity, accuracy, and timing.	35%
Weekly Grade	Behavior and performance — safety, initiative, preparation, attitude, work ethic and productivity.	30%
Classwork Assignments	Classroom exercises concerned with pacing time, staying on task, and following directions.	15%
Employability	Weekly and term-based soft skills centered on recurring assignments and professionalism in the shop.	20%

Half your grade is how you work, not what you make. Weekly Grade and Employability come to 50% between them. You can build something impressive and still not do well; a project can go wrong and you can still have a strong term. That is how you would be judged in an actual shop.

The weekly grade

Six things, in two groups, assessed every week. This is what excellent looks like.

	CRITERIA	THE STANDARD
Behavior	Safety	Follows all safety rules, maintains a clean work area, returns all materials to the proper place upon completing a task.
	Initiative	Stays on task, seeks additional work, offers assistance to peers, comes for help when needed, uses downtime effectively.
	Preparation	On time, agenda present, written instrument present, dressed to shop standards, awake and alert.
	Attitude	Positive attitude, interacts appropriately, appropriate language, maintains self-control at all times.
Performance	Work Ethic	Best efforts, cooperative, peer leadership, stays on task, self-starter, never publicly critical of the work of others.
	Productivity	Work of the highest quality, suggests solutions to problems, uses time well, provides useful ideas in discussion.

Excellent	Good	Fair	Unsatisfactory	Poor
100	92	78	52	28

Please read, sign and return

Return this page to Mr. Frank or Mr. Dryer during the first week. Keep the rest of the packet — you will want it later.

We have read and understood

- ☐ The classroom rules and privileges, including that some of them are privileges that can be lost.
- ☐ The uniform and footwear requirements, and how to order through the school store.
- ☐ The safety expectations, including that no tool is used without training and authorization.
- ☐ How the grade is calculated, including that half of it reflects how a student works.
